KEY

No calculator! Have fun!

1. Evaluate the following:

a)  $\tan \frac{7\pi}{6} = \frac{1}{\sqrt{3}}$

b)  $\sec \frac{4\pi}{3} = -2$

c)  $\cos(-\frac{7\pi}{6}) = -\frac{\sqrt{3}}{2}$

d)  $\cot \frac{99\pi}{4} = \cot(\frac{96\pi}{4} + \frac{3\pi}{4}) = -1$

e)  $\cos^{-1} \sin(-\frac{\pi}{6}) = \frac{2\pi}{3}$

f)  $\sin^{-1} \cos(-\frac{\pi}{6}) = \frac{\pi}{3}$

2. Write down all the relevant properties (period, amplitude, shifts/scales, asymptotes) of the following trig functions, and then graph by hand.

$$f(x) = 3 \sec 2\pi x$$

vertical scale 3  
 period 1  
 asymptotes  $x = \frac{1}{4} + \frac{n}{2}$  ( $n \in \mathbb{Z}$ )

forget to add:

domain:  $x \neq \frac{1}{4} + \frac{n}{2}$  ( $n \in \mathbb{Z}$ )

range =  $(-\infty, -3] \cup [3, \infty)$

$$g(x) = -3 \tan \pi x$$

vertical scale 3 (flipped)  
 period 1

asymptotes  $x = \frac{1}{2} + \frac{n}{2}$  ( $n \in \mathbb{Z}$ )

domain  $x \neq \frac{1}{2} + \frac{n}{2}$  ( $n \in \mathbb{Z}$ )

range  $\mathbb{R}$

3. Prove the identities:

$$(\sec \theta - \cos \theta)^2 + \sin^2 \theta = \tan^2 \theta$$

$$\begin{aligned}(\sec \theta - \cos \theta)^2 + \sin^2 \theta &= \sec^2 \theta - \underbrace{2\sec \theta \cos \theta}_{-2} + \underbrace{\cos^2 \theta + \sin^2 \theta}_1 \\&= \sec^2 \theta - 1 \\&= \tan^2 \theta \quad \checkmark\end{aligned}$$

$$\frac{\sin \theta}{\sec \theta - \cos \theta} = \cot \theta$$

$$\begin{aligned}\frac{\sin \theta}{\sec \theta - \cos \theta} &= \frac{\sin \theta}{\frac{1}{\cos \theta} - \cos \theta} \cdot \frac{\cos \theta}{\cos \theta} \\&= \frac{\sin \theta \cos \theta}{1 - \cos^2 \theta} \\&= \frac{\sin \theta \cos \theta}{\sin^2 \theta} \\&= \frac{\cos \theta}{\sin \theta} \\&= \cot \theta \quad \checkmark\end{aligned}$$

4. Use a sum formula to find  $\cos(195^\circ)$ .

$$\begin{aligned}
 \cos(195^\circ) &= \cos\left(\underset{3\pi/4}{135^\circ} + \underset{\pi/3}{60^\circ}\right) \\
 &= \cos 3\pi/4 \cos \pi/3 - \sin \frac{3\pi}{4} \sin \pi/3 \\
 &= \left(-\frac{\sqrt{2}}{2}\right)\left(\frac{1}{2}\right) - \frac{\sqrt{2}}{2} \frac{\sqrt{3}}{2} \\
 &= \frac{-\sqrt{2} - \sqrt{6}}{4}
 \end{aligned}$$

Derive the following half angle formula from the relevant double angle formula:

$$\cos u = \pm \sqrt{\frac{1 + \cos 2u}{2}}$$

$$\cos 2u = \cos^2 u - \sin^2 u$$

$$\cos 2u = 2\cos^2 u - 1$$

$$2\cos^2 u = 1 + \cos 2u$$

$$\cos^2 u = \frac{1 + \cos 2u}{2}$$

$$\cos u = \pm \sqrt{\frac{1 + \cos 2u}{2}}$$

Use the half angle formula above to find  $\cos(195^\circ)$ .

$$\begin{aligned}
 \cos 195^\circ &= \pm \sqrt{\frac{1 + \cos 390^\circ}{2}} \\
 &= \pm \sqrt{\frac{1 + \sqrt{3}/2}{2}} \\
 &= \pm \frac{\sqrt{2 + \sqrt{3}}}{2}
 \end{aligned}$$

5. Solve the following triangle:  $a = 10$ ,  $c = 10\sqrt{3}$ ,  $B = 30^\circ$ .

$$\begin{aligned} b^2 &= a^2 + c^2 - 2ac \cos B \\ &= 100 + 300 - 2 \cdot 10 \cdot 10\sqrt{3} \cdot \frac{\sqrt{3}}{2} \\ &= 400 - 300 \\ &= 100 \end{aligned}$$

$$\boxed{b = 10}$$

$$\frac{\sin A}{a} = \frac{\sin B}{b} \Rightarrow \sin A = \frac{a \sin B}{b} = \frac{10 \cdot \frac{1}{2}}{10}$$

$$\boxed{A = \frac{\pi}{6}} \text{ or } \frac{5\pi}{6} \text{ not possible: } B+A = \frac{\pi}{6} + \frac{5\pi}{6} = \pi$$

$$\boxed{C = \pi - A - B = \frac{\pi}{2}}$$

Solve the following triangle:  $a = 10$ ,  $b = 10$ ,  $C = 60^\circ$ .

$$\begin{aligned} c^2 &= a^2 + b^2 - 2ab \cos C \\ &= 100 + 100 - 200 \cdot \frac{1}{2} \\ &= 100 \end{aligned}$$

$$\boxed{c = 10}$$

$$\frac{\sin A}{a} = \frac{\sin C}{c} \Rightarrow \sin A = \frac{a \sin C}{c} = \frac{10 \cdot \frac{\sqrt{3}}{2}}{10} = \frac{\sqrt{3}}{2}$$

$$\boxed{A = \frac{\pi}{3}} \text{ or } \frac{2\pi}{3} \text{ can't happen}$$

$$\boxed{B = \pi - A - C = \frac{\pi}{3}}$$
